gather()

Collapses multiple columns into two columns:

1. a **key** column that contains the former column names
2. a **value** column that contains the former column cells

```
gather(cases, "year", "n", 2:4)
```

Your Turn

Imagine how the pollution data set would look tidy with three variables: *city, large, small*

pollution

city	size	amount
New York	large	23
New York	small	14
London	large	22
London	small	16
Beijing	large	121
Beijing	small	56
